

## HVU adhesive with HAS rod

<b>Features:</b>	
	- foil capsule vs. glass
	- flexible for inserting into crooked / irregular holes
	- pre-setting / through-setting
	- specials lengths available on request
	- test reports: fire, dynamic (fatigue, shock, seismic), water tightness
<b>Material:</b>	
<b>HVU:</b>	- urethane methacrylate resin – styrene free, hardener, quartz sand or corundum, foil tube
<b>HAS, HAS-E:</b>	- grade 5.8 and 8.8, ISO 898 T1, galvanised to min. 5 microns
<b>HAS-R / -ER:</b>	- stainless steel; A4-70; 1.4401, 1.4404, 1.4571
<b>HAS-HCR:</b>	- stainless steel; 1.4529

### Basic loading data (for a single anchor): HVU capsule with HAS, HAS-E

All data on this page applies to

For detailed design method, see pages 204 – 208.

- concrete: See table below.
- correct setting (See setting operations page 203)
- no edge distance and spacing influence
- **steel failure:** steel grade 5.8 for M8 – M24 sizes and steel grade 8.8 for M27 – M39

Mean ultimate resistance,  $R_{u,m}$  [kN]: concrete  $\cong$  C20/25

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39

Rec. diamond drilling machine			DD EC-1								DD 100 // DD 160 E			

<sup>1)</sup> The values for the maximum fixture thickness are only valid for the HAS anchor rods given in this table. If other HAS rods are used, these values will change. (Example: HAS M12x110/128; t<sub>fix</sub> = 128 mm)

Temperature <sup>1)</sup> when setting:	Min. time to wait before removing <b>SCREWED-ON</b> setting tool, t <sub>rel</sub>	Curing time before anchor can be fully loaded, t <sub>cure</sub>
20°C and above	8 min.	20 min.
10°C to 20°C	20 min.	30 min.
0°C to 10°C	30 min.	60 min.
-5°C to 0°C	60 min.	5 hours

<sup>1)</sup> If the temperature is less than -5°C, contact your Hilti technical service.

## Installation equipment

Rotary hammer (TE1, TE 2, TE5, TE6, TE6A, TE15, TE15-C, TE18-M, TE 35, TE 55 or TE 76) or a diamond drilling machine, a drill bit, a TE-C HEX, TE-C-E TE-Y-E setting tool and a blow-out pump.

### Setting operations

Drill hole.

Blow out dust and fragments.

Insert HVU capsule.

Drive in anchor.

Allow gel time to pass.

Wait for curing.

Apply tightening torque.

°C	t <sub>rel</sub>	t <sub>cure</sub>
-5° ... 0°	60'	5 h
0° ... 10°	30'	60'
10° ... 20°	20'	30'
20° ... 40°	8'	20'

		HAS-R	14.3	28.7	50.6	131.4	256.7	443.5	478.8	641.5	893.0	1134.9	1484.5
		-HCR	14.3	28.7	50.6	131.4	256.7	443.5	478.8	641.5	893.0	1134.9	1484.5
S <sub>w</sub> [mm]	Width across flats	13	17	19	24	30	36	41	46	50	55	59	
d <sub>w</sub> [mm]	Washer diameter	16	20	24	30	37	44	50	56	60	66	72	

<sup>1)</sup> The design bending resistance of the anchor rod is calculated from  $M_{Rd,s} = (1.2 \cdot W \cdot f_{uk}) / \gamma_{Ms,b}$ , where the partial safety factor,  $\gamma_{Ms,b}$ , for grade 5.8 and 8.8 rods is 1.25 and for 1.56 for A4-70 and HCR. The final safety check is then  $M_{Sk} \cdot \gamma_F \leq M_{Rd,s}$

### Detailed design method - Hilti CC

(The Hilti CC method is a simplified version of ETAG Annex C.)

**Caution:** In view of the high loads transferable with HVU, it must be verified by the user that the load acting on the concrete structure, including the loads introduced by the anchor fastening, do not cause failure, e.g. cracking, of the concrete structure.

### TENSION

The design tensile resistance of a single anchor is the lower of

$N_{Rd,c}$  : concrete cone/pull-out resistance

$N_{Rd,s}$  : steel resistance

### $N_{Rd,c}$ : Concrete cone/pull-out resistance

$$N_{Rd,c} = N_{Rd,c}^0 \cdot f_{B,N} \cdot f_T \cdot f_{A,N} \cdot f_{R,N}$$

### $N_{Rd,c}^0$ : Concrete cone/pull-out design resistance

- Concrete compressive strength,  $f_{ck,cube(150)} = 25 \text{ N/mm}^2$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39
$N_{Rd,c}^0$ <sup>1)</sup> [kN]	12.4	16.6	23.8	34.7	62.9	90.6	110.9	145.6	171.0	203.3	232.9
$h_{nom}$ [mm] Nominal anchorage depth	80	90	110	125	170	210	240	270	300	330	360

<sup>1)</sup> The design tensile resistance is calculated from the characteristic tensile resistance,  $N_{Rk,c}$ , by  $N_{Rd,c}^0 = N_{Rk,c}^0 / \gamma_{Mc,N}$ , where the partial safety,  $\gamma_{Mc,N}$ , factor is 1.8.

### $f_{B,N}$ : Influence of concrete strength

Designation of grade of concrete (ENV 206)	Cylinder compressive strength, $f_{ck,cyl}$ [N/mm <sup>2</sup> ]	Cube compressive strength, $f_{ck,cube}$ [N/mm <sup>2</sup> ]	$f_{B,N}$
C16/20	16	20	0.94
C20/25	20	25	1
C25/30	25	30	1.05
C30/37	30	37	1.12
C35/45	35	45	1.20
C40/50	40	50	1.25
C45/55	45	55	1.30
C50/60	50	60	1.35

Concrete cylinder: height 30cm, 15cm diameter	Concrete cube: side length 15cm
Concrete test specimen geometry	

$$f_{B,N} = 1 + \left( \frac{f_{ck,cube} - 25}{80} \right)$$

for  $f_{ck,cube} = 20 \text{ N/mm}^2$

$$f_{B,N} = 1 + \left( \frac{f_{ck,cube} - 25}{100} \right)$$

Limits:

$25 \text{ N/mm}^2 \leq f_{ck,cube} \leq 60 \text{ N/mm}^2$

## HVU adhesive with HAS rod

### $f_T$ : Influence of anchorage depth

$$f_T = \frac{h_{act}}{h_{nom}} \quad \text{Limits to actual anchorage depth } h_{act}: h_{nom} \leq h_{act} \leq 2.0 h_{nom}$$

### $f_{A,N}$ : Influence of anchor spacing

Anchor spacing, s [mm]	Anchor size										
	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39

300									1,00	0,93	0,88
330										1,00	0,94
360											1,00

$$f_{R,N} = 0,28 + 0,72 \frac{c}{h_{nom}}$$

Limits:  $c_{min} \leq c \leq c_{cr,N}$   
 $c_{min} = 0,5 \cdot h_{nom}$   
 $c_{cr,N} = 1,0 \cdot h_{nom}$

**Note:** If more than 3 edges are smaller than  $c_{cr,N}$ , consult your Hilti technical advisory service.

## HVU adhesive with HAS rod

### $N_{Rd,s}^{1)}$ : Steel design tensile resistance

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39
HAS grade 5.8 <sup>2)</sup> [kN]	10,9	17,4	25,4	48,1	75,1	108,1	142,3	173,0	215,7	253,1	304,3
HAS grade 8.8 <sup>2)</sup> [kN]	17,5	27,9	40,7	78,9	120,1	172,9	227,8	276,8	345,2	404,9	486,9
HAS-R,HAS-HCR <sup>2)3)</sup> [kN]	12,3	19,6	28,6	54,0	84,3	121,0	89,0	108,1	134,8	158,2	190,2

<sup>1)</sup> The design tensile resistance is calculated from the characteristic tensile resistance,  $N_{Rk,s}$ , using  $N_{Rd,s} = A_s \cdot f_{uk} / \gamma_{Ms,N}$ , where the partial safety factor,  $\gamma_{Ms,N}$ , for grade 5.8 and 8.8 is 1.5; 1.87 for grades A4-70 and HCR of the M8 to M24 sizes and 2.4 for grades A4-70 and HCR in the sizes M27 – M39.

<sup>2)</sup> Data given in *italics* applies to non-standard rods.

<sup>3)</sup> Note: The values for the nominal tensile steel strength,  $f_{uk}$ , for grade A4 change for the M27 to M39 sizes from 700 N/mm<sup>2</sup> to 500 N/mm<sup>2</sup> and the yield strength,  $f_{yk}$ , changes for the M27 to M39 sizes from 450 N/mm<sup>2</sup> to 250 N/mm<sup>2</sup>. The partial safety factor,  $\gamma_{Ms,N}$ , changes with the steel strengths as stated in note <sup>1)</sup> above.

### $N_{Rd}$ : System design tensile resistance

$$N_{Rd} = \text{lower of } N_{Rd,c} \text{ and } N_{Rd,s}$$

**Combined loading:** Only if tensile load and shear load applied (See page 31 and section 4 “Examples”).

### Detailed design method – Hilti CC

(The Hilti CC method is a simplified version of ETAG Annex C.)

### SHEAR

The design shear resistance of a single anchor is the lower of

$V_{Rd,c}$  : concrete edge resistance

$V_{Rd,s}$  : steel resistance

**Note:** If the conditions for h and  $c_2$  are not met, consult your Hilti technical advisory service.

### $V_{Rd,c}$ : Concrete edge design resistance

The lowest concrete edge resistance must be calculated. All near edges must be checked, (not only the edge in the direction of shear). The direction of shear is accounted for by the factor  $f_{\beta,V}$ .

$$V_{Rd,c} = V_{Rd,c}^0 \cdot f_{\beta,V} \cdot f_{AR,V} \cdot f_{\beta,V}$$

## $V_{Rd,c}^0$ : Concrete edge design resistance

- Concrete compressive strength,  $f_{ck,cube(150)} = 25 \text{ N/mm}^2$
- at a minimum edge distance  $c_{min}$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39
$V_{Rd,c}^0$ [kN]	2.6	3.4	5.0	6.7	12.4	18.5	23.6	30.2	36.8	44.3	52.1
$c_{min}$ [mm] min. edge distance	40	45	55	65	85	105	120	135	150	165	180

<sup>1)</sup> The design shear resistance is calculated from the characteristic shear resistance,  $V_{Rk,c}^0$ , using  $V_{Rd,c}^0 = V_{Rk,c}^0 / \gamma_{Mc,V}$ , where the partial safety factor,  $\gamma_{Mc,V}$ , is 1.5.

## $f_{B,V}$ : Influence of concrete strength

Concrete strength designation (ENV 206)	Cylinder compressive strength, $f_{ck,cyl}$ [N/mm <sup>2</sup> ]	Cube compressive strength, $f_{ck,cube}$ [N/mm <sup>2</sup> ]	$f_{B,N}$
C16/20	16	20	0.89
C20/25	20	25	1
C25/30	25	30	1.1
C30/37	30	37	1.22
C35/45	35	45	1.34
C40/50	40	50	1.41
C45/55	45	55	1.48
C50/60	50	60	1.55

Concrete cylinder: height 30cm, 15cm diameter	Concrete cube: side length 15cm
Concrete test specimen geometry	

$$f_{B,V} = \sqrt{\frac{f_{ck,cube}}{25}}$$

Limits:

$$20 \text{ N/mm}^2 \leq f_{ck,cube} \leq 60 \text{ N/mm}^2$$

## $f_{AR,V}$ : Influence of spacing and edge distance

Formula for **single**-anchor fastening influenced only by edge

$$f_{AR,V} = \frac{c}{c_{min}} \sqrt{\frac{c}{c_{min}}}$$

Formula for **two**-anchor fastening (edge plus 1 spacing) only valid for  $s < 3c$

$$f_{AR,V} = \frac{3c + s}{6c_{min}} \sqrt{\frac{c}{c_{min}}}$$

General formula for **n**-anchor fastening (edge plus n-1 spacing) only valid where  $s_1$  and  $s_{n-1}$  are each  $< 3c$  and  $c_2 > 1.5c$

$$f_{AR,V} = \frac{3c + s_1 + s_2 + \dots + s_{n-1}}{3nc_{min}} \sqrt{\frac{c}{c_{min}}}$$

results tabulated below

Note: It is assumed that only the row of anchors closest to the free concrete edge carries the centric shear load.

## HVU adhesive with HAS rod

### $f_{AR,V}$ : Influence of edge distance and spacing

$f_{AR,V}$	$c/C_{min}$ →																
	1,0	1,2	1,4	1,6	1,8	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	3,8	4,0

	3,0	1,00	1,20	1,42	1,64	1,88	2,12	2,37	2,63	2,90	3,18	3,46	3,76	4,06	4,36	4,68	5,00
	3,5		1,30	1,52	1,75	1,99	2,24	2,50	2,76	3,04	3,32	3,61	3,91	4,21	4,52	4,84	5,17
	4,0			1,62	1,86	2,10	2,36	2,62	2,89	3,17	3,46	3,75	4,05	4,36	4,68	5,00	5,33
	4,5				1,96	2,21	2,47	2,74	3,02	3,31	3,60	3,90	4,20	4,52	4,84	5,17	5,50
	5,0					2,33	2,59	2,87	3,15	3,44	3,74	4,04	4,35	4,67	5,00	5,33	5,67
	5,5						2,71	2,99	3,28	3,57	3,88	4,19	4,50	4,82	5,15	5,49	5,83
	6,0						2,83	3,11	3,41	3,71	4,02	4,33	4,65	4,98	5,31	5,65	6,00
	6,5							3,24	3,54	3,84	4,16	4,47	4,80	5,13	5,47	5,82	6,17
	7,0								3,67	3,98	4,29	4,62	4,95	5,29	5,63	5,98	6,33
	7,5									4,11	4,43	4,76	5,10	5,44	5,79	6,14	6,50
	8,0										4,57	4,91	5,25	5,59	5,95	6,30	6,67
	8,5											5,05	5,40	5,75	6,10	6,47	6,83
9,0											5,20	5,55	5,90	6,26	6,63	7,00	
9,5												5,69	6,05	6,42	6,79	7,17	
10,0													6,21	6,58	6,95	7,33	
10,5														6,74	7,12	7,50	
11,0															7,28	7,67	
11,5																7,83	
12,0																8,00	

These results are for a two-anchor fastening. For fastenings with more than two anchors, use the general formulae for n anchors.

### $f_{\beta,V}$ : Influence of shear loading direction

Angle, $\beta$ [°]	$f_{\beta,V}$
0 to 55	1
60	1.1
70	1.2
80	1.5
90 to 180	2

#### Formulae:

$$f_{\beta,V} = 1 \quad \text{for } 0^\circ \leq \beta \leq 55^\circ$$

$$f_{\beta,V} = \frac{1}{\cos \beta + 0.5 \sin \beta} \quad \text{for } 55^\circ < \beta \leq 90^\circ$$

$$f_{\beta,V} = 2 \quad \text{for } 90^\circ < \beta \leq 180^\circ$$

### $V_{Rd,s}^{1)}$ : Steel design shear resistance

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39
HAS grade 5.8 <sup>2)</sup> [kN]	7,9	12,6	18,3	34,6	54,0	77,8	102,5	124,6	155,3	182,2	219,1
HAS grade 8.8 <sup>2)</sup> [kN]	12,6	20,1	29,3	55,3	86,4	124,4	164,0	199,3	248,4	291,5	350,6
HAS-R, HAS-HCR <sup>2)3)</sup> [kN]	8.8	14.1	20.5	38.8	60.6	87.2	64.1	77.9	97.1	113.9	137

<sup>1)</sup> The design shear resistance is calculated using  $V_{Rd,s} = (0,6 A_s f_{uk}) / \gamma_{Ms,V}$ . The values for the stressed cross-section,  $A_s$ , and the nominal tensile strength of steel,  $f_{uk}$ , are given in the table "Anchor mechanical properties and geometry". The partial safety factor,  $\gamma_{Ms,V}$ , is 1.25 for grades 5.8 and 8.8; 1.56 for grade sA4-70 and HCR in the sizes M8 to M24, and 2.0 for grade A4-70 in the sizes M27 to M39.

<sup>2)</sup> Data given in **italics** applies to non-standard rods.

<sup>3)</sup> Note: The values for the nominal tensile strength of steel,  $f_{uk}$ , for grade A4-70 change for the M27 to M39 sizes from 700 N/mm<sup>2</sup> to 500 N/mm<sup>2</sup> and the yield strength,  $f_{yk}$ , changes for the M27 to M39 sizes from 450N/mm<sup>2</sup> to 250N/mm<sup>2</sup>. The partial safety factor,  $\gamma_{Ms,V}$ , changes the steel strengths as stated in note <sup>1)</sup> above.

### $V_{Rd}$ : System design shear resistance

$$V_{Rd} = \text{lower of } V_{Rd,c} \text{ and } V_{Rd,s}$$

**Combined loading:** Only if tensile load and shear load applied (See page 31 and section 4 "Examples").
